

Functional Requirements

Sprint 1 User Stories

View Patient Personal Information

As a coordinator, I want to view the personal information of my patients so that I can verify their identity when they arrive for their appointments.

Patient personal information includes:

- Last name
- First name
- Date of birth
- Gender
- Address
- Phone

Update Patient Personal Information

As a coordinator, I want to update patient personal information when they arrive for an appointment so that our records stay up to date.

Add Patient Personal Information

As a coordinator, I want to add personal information for patients so that they can book appointments.

The address and phone number are optional for a valid patient record.

Sprint 2 User Stories

View Patient Medical History

As a physician, I want to view the medical history of my patient so that I can be aware of any past health issues.

Add a Note to Patient Medical History

As a physician, I want to add an observation note to the patient medical history so that I can track whether they are following my recommendations between sessions

.

Sprint 3 User Story and Remaining Requirements

Generate a Diabetes Report

As a physician, I want to assess the risk of early onset diabetes for a patient so that I can warn them if their health is potentially at risk.

A patient can have one of four risk levels:

- None
- Borderline
- In Danger
- Early Onset

Rules for Determining Risk Levels

- **None:** The patient's file does not contain enough trigger terms (terminology) to meet any of the other risk levels. This is the default level.
- **Borderline:** The patient's file contains between two and five trigger terms, and the patient is over 30 years old.
- **In Danger:** This depends on the patient's age and gender:
 - If the patient is a male under 30 years old, three or four trigger terms must be present.
 - If the patient is a female under 30 years old, four or five trigger terms must be present.
 - If the patient is over 30 years old, six or seven trigger terms must be present.
- **Early Onset:** Again, this depends on age and gender:
 - If the patient is a male under 30 years old, at least five trigger terms are required.
 - If the patient is a female under 30 years old, at least six trigger terms are required.
 - If the patient is over 30 years old, eight or more trigger terms are required.

Trigger Terms to Look for in Physician Notes:

- Hemoglobin A1C
- Microalbumin
- Height
- Weight
- Smoking
- Abnormal
- Cholesterol
- Dizziness
- Relapse
- Reaction
- Antibody
